Art Unit: 2176

#### **DETAILED ACTION**

- 1. This action is responsive to communications: CPA filed 10/29/2002, to the original application filed 11/13/1998. IDS filed 11/13/1998 (paper #4), and 7/9/2001 (paper #5).
- 2. The rejection of claims 1, 4-6 under 35 U.S.C. 103(a) as being unpatentable over Irons has been withdrawn as necessitated by amendment.
- 3. Claims 2-3 remain rejected under 35 U.S.C. 103(a) as being unpatentable over Irons and Xerox.
- 4. Claims 11, 14-15 remain rejected under 35 U.S.C. 103(a) as being unpatentable over Irons and Barton.
- 5. Claims 1-6, 11, 14-15 are pending. Claims 1, 11, 14-15 are independent claims.

#### **Continued Prosecution Application**

6. The request filed on 10/29/2002 for a Continued Prosecution Application (CPA) under 37 CFR 1.53(d) based on parent Application No. 09/192,014 is acceptable and a CPA has been established. An action on the CPA follows.

#### Claim Rejections - 35 USC § 103

- 7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2176

8. Claims 1-6, are rejected under 35 U.S.C. 103(a) as being unpatentable over Irons, U.S. Patent No. 6,192,165, filed December 30, 1997, and issued February 20, 2001, in view of *Xerox touts DataGlyphs for paper data* (hereinafter Xerox), Seybold Report on Desktop Publishing, Vol. 9, No. 5, copyright 1996, pp.1-3, downloaded on 12/6/2001 from <url>
http://www.seyboldseminars.com/seybold\_report/reports/D0905001.HTM>.

In regard to independent claim 1, Irons teaches a scanner for scanning a document along with an affixed label (Irons column 8 lines 1-10; compare with claim 1 "A method for processing....comprising the steps of", and "scanning the document to produce an image representative of the document").

Irons teaches subsequent to scanning, locating and decoding the digitized label from said document, said label associated with a user ID (Irons column 8 lines 4-10, column 11 lines 30-36, Figure 5; compare with claim 1 "locating the user interface tag in the image", "decoding data represented in the user interface tag", and "...a user identity...").

Irons teaches storing said number as an index (linked) to a database for facilitating later retrieval of a document onto an output device, as well as a document invoice indicative of a service (Irons column 7 lines 55-61, Figure 8, 9). Irons does not specifically teach performing a service associated with document data. However, this limitation would have been obvious to one of ordinary skill in the art at the time of the invention, in view of Irons, because Irons teaches that the machine readable portion of a label may contain additional information, such as information on document disposition (Irons column 11 lines 22-26; compare with claim 1 "associating the data with a service....performing the specified service"), suggesting a performed service, and providing the advantage of disposition associated with the invoices of Irons Figure 8, 9.

Irons teaches a scanned office form (an invoice) with a machine readable code in the upper right corner of said invoice, said code can contain additional information regarding document disposition (see

Art Unit: 2176

above). Said invoice also contains images indicating two handwritten signatures, as well as a bulleted area indicating type of payment in the lower left portion of said invoice (Irons Figure 9 item 920). Irons does not specifically teach performing a service on the image of the scanned form. However, Xerox teaches DataGlyphs, which can encode and read machine readable information (including executable commands) applied to office forms, using SmartPaper Controls (Xerox page 2 section "SmartPaper Controls"). SmartPaper can perform the service of electronically verifying whether a form has been signed (Xerox page 2 section "Signature regions"). Since multiple signatures are typically applied on said invoice at different times (i.e. supervisors and sales people in different buildings), the DataGlyphs are updated accordingly. It would have been obvious to one of ordinary skill in the art at the time of the invention to apply Xerox's signature verification within Iron's machine readable code, providing Irons the benefit of signature verification, since verifying the presence of handwritten signatures has a necessary bearing on the disposition of an invoice form (compare with claim 1 "performing the specified service on the image representative of the document.").

In regard to dependent claims 2-3, Irons teaches identification of a machine readable ID image bar code label (Irons Figure 4; compare with claim 2 "identifying a connected component in the image") Irons teaches the use of high density symbologies for encoding an image file (Irons column 11 lines 18-23). Irons does not specifically teach finding extreme points, determination of a diagonal length, and a rectangle including said points, as well determination of a lattice of glyphs, a seed glyph, identifying a rotation, and converting said glyphs to binary data. However, Xerox teaches DataGlyph coding, which comprises blocks (rectangles) of data represented as diagonal lines, the analyzed slope of which (either left or right) are indicative of binary data within an analyzed block. The data is grouped into blocks to which framing is added. In addition, said coding is embedded in an error-correcting code utilizing redundant bits, and encoded bytes reordered in a psuedorandom way (requiring a seed) (Xerox pages 1-3, especially bottom of page 1 to top of page 2; compare with claims 2-3). It would have been obvious to

Art Unit: 2176

one of ordinary skill in the art at the time of the invention to apply Xerox to Irons, because of Xerox's taught advantage of DataGlyphs, providing the labels of Irons a symbology especially designed for the rigors of a hardcopy environment (Xerox page 2, near top).

In regard to dependent claim 4, Irons teaches extracting a user identity code from an analyzed label, said code associated with a database for additional information (Irons column 8 lines 5-14, column 11 lines 29-40, Figure 5).

In regard to dependent claims 5-6, Irons teaches storing a code as an index (linked) to a database for facilitating later retrieval of a document onto an output device, as well as a document invoice indicative of a service (Irons column 7 lines 55-61, Figure 8, 9). Irons does not specifically teach extracting a service code. However, this limitation would have been obvious to one of ordinary skill in the art at the time of the invention, in view of Irons, because Irons teaches that the machine readable portion of a label may contain additional information, such as information on document disposition (Irons column 11 lines 22-26; compare with claims 5-6, suggesting a service (or invoice) code associated with said invoice, and providing the advantage of an index code associated with the invoices of Irons Figures 8, 9.

9. Claims 11, 14-15, are rejected under 35 U.S.C. 103(a) as being unpatentable over Irons, U.S. Patent No. 6,192,165, filed December 30, 1997, issued February 20, 2001, in view of Barton et al. (hereinafter Barton), U.S. Patent No. 5,998,752, filed March 16, 1998, issued December 7, 1999.

In regard to dependent claim 11, Irons teaches printing a document label comprising a machine-readable data code, said label is associated with, and affixed to a hardcopy document prior to scanning of said document, said code incorporating a user identity code (Irons column 11 lines 4-15, 27-

Art Unit: 2176

41, column 12 lines 41-60; compare with claim 11 "A user interface tag....code representative of a user's identity").

Irons does not specifically teach a service code for specifying a service to be performed on a hardcopy document. However, Barton teaches a mail processing system including sorting stations for various pieces of mail. The sorting of a mail item is dependent upon the intended address of a mail item, as well as class of service, etc. (Barton column 1 lines 5-8, 59-62, column 2 lines 1-10). A bar code can be applied to a mail item, uniquely identifying said item (Barton column 2 lines 11-14, 55-58). It is to be noted that a bar code can be applied to a post card, since a post card is a known form of a hardcopy document, as well as a known form of mail item. Barton teaches printing a routing code (a machine-readable form of the destination address) onto said mail item (Barton column 4 lines 64-67, column 5 lines 1-5). The routing code specifies a service to be performed on a mail item (i.e. a post card), since the routing code is used by the sorting system (and by a post office in general), to direct said mail item to a particular destination (compare with claim 11 "a service code specifying a service to be performed on said hardcopy document."). It would have been obvious to one of ordinary skill in the art at the time of the invention to apply Barton's routing code to Irons bar code information, providing Irons the capability of mailing a printed copy of an invoice to a destination (Irons Figure 9) using a routing code.

In regard to independent claim 14, Irons teaches creating user interface tags associated with documents (Irons Abstract; compare with claim 14 "An apparatus for....comprising:").

Irons teaches receiving information (user ID) reflective of a user, said user ID used for creating a unique document number (identity code) (Irons column 11 lines 27-42, Figure 5; compare with claim 14 "an identity processor adapted to receive user information and create an identity code").

Irons teaches storing said number as an index to a database (Irons column 7 lines 50-60; compare with claim 14 "a user information database....with the identity code").

Art Unit: 2176

Irons teaches printing a user interface sticker comprising a machine readable identity code (Irons column 12 lines 41-50, Figure 4; compare with claim 14 "an output device capable of printing a tag bearing....representative of the identity code").

Irons does not specifically teach a service code for specifying a service to be performed on a hardcopy document. However, Barton teaches a mail processing system including sorting stations for various pieces of mail. The sorting of a mail item is dependent upon the intended address of a mail item, as well as class of service, etc. (Barton column 1 lines 5-8, 59-62, column 2 lines 1-10). A bar code can be applied to a mail item, uniquely identifying said item (Barton column 2 lines 11-14, 55-58). It is to be noted that a bar code can be applied to a post card, since a post card is a known form of a hardcopy document, as well as a known form of mail item. Barton teaches printing a routing code (a machine-readable form of the destination address) onto said mail item (Barton column 4 lines 64-67, column 5 lines 1-5). The routing code specifies a service to be performed on a mail item (i.e. a post card), since the routing code is used by the sorting system (and by a post office in general), to direct said mail item to a particular destination (compare with claim 14 "a service to be performed on a document to which said user interface tag is affixed."). It would have been obvious to one of ordinary skill in the art at the time of the invention to apply Barton's routing code to Irons bar code information, providing Irons the capability of mailing a printed copy of an invoice to a destination (Irons Figure 9) using a routing code.

In regard to independent claim 15, Irons teaches a scanner for scanning a document along with an affixed label (Irons column 8 lines 1-10; compare with claim 15 "a scanner adapted....of the document").

Irons teaches subsequent to scanning, identifying an decoding the digitized label from said document (Irons column 8 lines 4-10; compare with claim 15 "an action processor adapted to identify....in the user interface tag").

Art Unit: 2176

Irons does not specifically teach a service code for specifying a service to be performed on a hardcopy document. However, Barton teaches a mail processing system including sorting stations for various pieces of mail. The sorting of a mail item is dependent upon the intended address of a mail item, as well as class of service, etc. (Barton column 1 lines 5-8, 59-62, column 2 lines 1-10). A bar code can be applied to a mail item, uniquely identifying said item (Barton column 2 lines 11-14, 55-58). It is to be noted that a bar code can be applied to a post card, since a post card is a known form of a hardcopy document, as well as a known form of mail item. Barton teaches printing a routing code (a machine-readable form of the destination address) onto said mail item (Barton column 4 lines 64-67, column 5 lines 1-5). The routing code specifies a service to be performed on a mail item (i.e. a post card), since the routing code is used by the sorting system (and by a post office in general), to direct said mail item to a particular destination (compare with claim 15 "said information including information indicating a service to be performed on said hardcopy document."). It would have been obvious to one of ordinary skill in the art at the time of the invention to apply Barton's routing code to Irons bar code information, providing Irons the capability of mailing a printed copy of an invoice to a destination (Irons Figure 9) using a routing code.

Irons teaches storing said number as an index (linked) to a database for facilitating later retrieval of a document onto an output device (Irons column 7 lines 55-61; compare with claim 15 "a device operated by the....represented in the user interface tag.").

Application/Control Number: 09/192,014 Page 9

Art Unit: 2176

10. Prior art made of record and not relied upon is considered pertinent to disclosure.

Davies et al. U.S. Patent No. 6,470,096 issued 10-2002

Rhoads U.S. Patent No. 6,427,020 issued 07-2002

### Response to Arguments

11. Applicant's arguments filed 10/29/2002 have been fully and carefully considered but they are not persuasive.

Applicant argues on page 3 to top of page 4 of the amendment that Irons does not teach that the claimed interface tag of the application itself specifies the service to be performed on a document image. The examiner uses Xerox to teach signature verification as applied to the current round of rejections.

Applicant argues on page 4 of the amendment that Irons does not teach "extracting a service code". The examiner notes that Irons teaches an invoice number to indicate an invoice (Irons Figure 9). Since retail/wholesale invoices typically involve signatures, a typical service is to verify presence of said signatures. In the past, this was accomplished via visual inspection, however, Xerox can perform this "service" electronically to verify a scanned invoice, said verification having a bearing on the invoice's disposition.

Applicant argues on page 5 of the amendment that Barton's "routing code" is information that is used in performing the service itself, and the code itself does not define or describe a service. The examiner notes that, although the service of routing a mail document may be partially pre-defined, the routing code is a necessary part of the process. Since said code is required for the service to be executed, said code acts to define said service by defining where to route said mail.

Page 10

Application/Control Number: 09/192,014

Art Unit: 2176

Applicant argues on page 6 of the amendment that Irons does not teach (hardcopy) mailing of an invoice. In additional support of the present rejections, the examiner notes that ordering products online, as well as catalogue and/or retail/wholesale ordering of physical goods generally involve physical invoices, and (in the case of online/catalogue orders), the products are typically mailed with confirming invoices.

Applicant argues on page 6 of the amendment that the finality of the rejection was improper. The examiner respectfully notes that this issue was previously addressed (see Advisory Action – paper 11, mailed October 4, 2002).

#### Conclusion

12. Any inquiry concerning this communication or earlier communications from the examiner should be directed to William Bashore whose telephone number is (703) 308-5807. The examiner can normally be reached on Monday through Friday from 11:30 AM to 8:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Heather Herndon, can be reached on (703) 308-5186.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist whose telephone number is (703) 305-3900.

Art Unit: 2176

## 13. Any response to this action should be mailed to:

Commissioner of Patents and Trademarks Washington, D.C. 20231

or faxed to:

(703) 746-7239 (for formal communications intended for entry)

or:

(703) 746-7240 (for informal or draft communications, please label "PROPOSED" or "DRAFT")

or:

(703) 746-7238 (for after-final communications)

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA, Fourth Floor (Receptionist).

William L. Bashore 01/09/2003
